    (mu, sigma) = norm.fit(data)

    #Kernel Density plot
    fig1 = fig.add_subplot(121)
    sns.distplot(data, fit=norm)
    fig1.set_title(measure + ' Distribution ( mu = {:.2f} and sigma = {:.2f} )'.format(mu, sigma), loc='center')
    fig1.set_xlabel(measure)
    fig1.set_ylabel('Frequency')

    #QQ plot
    fig2 = fig.add_subplot(122)
    res = probplot(data, plot=fig2)
    fig2.set_title(measure + ' Probability Plot (skewness: {:.6f} and kurtosis: {:.6f} )'.format(data.skew(), data.kurt()), loc='center')

    plt.tight_layout()
    plt.show()

```

A Quantile-Quantile (QQ) plot is a graphical tool to assess if a dataset follows a specified distribution, typically the normal distribution. It does this by plotting the quantiles of the dataset against the quantiles of the theoretical distribution. If the points roughly follow a straight line, the data is approximately normally distributed. Key Components of a QQ Plot

How to Interpret a QQ Plot

Straight Line: If the points form a roughly straight line, the data follows the theoretical distribution.  
 S-shaped Curve: If the points form an S-shape, the data may have heavier tails than the theoretical distribution.  
 Convex/Concave Curve: Indicates a skewness in the data.

# \*\*TO-DO\*\* Generate the below Recency graphs using the QQ\_plot function

## ✓ Customer Segmentation Using Quantiles

```
# **T0-D0** Calcualte the quantils for recency, frenuency, and monetary
```

```
print(quantil)
```

```
<ipython-input-52-1834c5c73f06>:12: UserWarning:
```

|      | Recency | Frequency | Monetary |
|------|---------|-----------|----------|
| 0.25 | 17.00   | 1.00      | 291.80   |
| 0.50 | 51.00   | 3.00      | 644.07   |
| 0.75 | 144.00  | 5.00      | 1608.34  |

Quantiles in General:

0.25 Quantile (25th Percentile): This is the value below which 25% of the data falls. It's also known as the first quartile.

0.50 Quantile (50th Percentile): This is the median, the middle value of the data. Half of the data lies below this value.

0.75 Quantile (75th Percentile): This is the value below which 75% of the data falls. It's also known as the third quartile.

```
# Convert quantil into dict to access each value
```

```
quantil = quantil.to_dict()
print(quantil)
```

```
<ipython-input-52-1834c5c73f06>:12: UserWarning:
```

```
{'Recency': {0.25: 17.0, 0.5: 51.0, 0.75: 144.0}, 'Frequency': {0.25: 1.0, 0.5: 3.0, 0.75: 5.0}, 'Monetary': {0.25: 291.795, 0.5: 644.0699999999999, 0.75: 1608.34}}
```

RecencyPoints Function: Assigns points to customers based on how recently they made their last purchase, giving higher scores (4) to more recent purchases.

Freq\_MonetaryPoints Function: Assigns points to customers based on their purchase frequency and monetary value, giving higher scores to more frequent and higher spending customers.

Application: These functions are applied to the DataFrame to segment customers into quartiles for each RFM metric, facilitating further analysis and customer segmentation.

By applying these functions, businesses can better understand customer behavior and tailor marketing strategies accordingly, targeting different customer segments based on their RFM scores.

```
